

1. A dataset containing the years of experience and monthly salary (RM) of UTP employees.

Experience_Years	Monthly_Salary
1	2500
2	2700
3	3000
4	3400
5	3900
6	4400
7	5000
8	5600
9	6200
10	6900

- Create a simple linear regression model to predict the employees' monthly salary based on their years of experience. Use 70% of the data for training and 30% for testing the model.
- Visualize the output of the proposed model in part (a) using a scatter plot with a regression line

2. A dataset containing ozone quality (Y) based on Solar.R(X_1), Wind, (X_2), and Temp (X_3).

Ozone	Solar.R	Wind	Temp
11	290	9.2	66
11	44	9.7	62
11	320	16.6	73
12	149	12.6	74
12	120	11.5	73
13	137	10.3	76
13	112	11.5	71
13	27	10.3	76
13	238	12.6	64
14	274	10.9	68

- Create a multiple linear regression model to predict the Ozone(Y) based on Solar.R(X_1), Wind, (X_2), and Temp (X_3) on the dataset provided. Use 70% of the data for training and 30% for testing the model.
